**Subject:** RE: USEPA Update on Certain Sites

**EPA will compare the data collected at the Chicago facility with the minimum risk level established by the Agency for Toxic Substances and Disease Registry (“ATSDR”) for chronic-duration (365 days or more) inhalation of airborne respirable manganese. ATSDR’s MRL is 0.3 µg/m3, which is the standard EPA recently used -- in addition to demonstrated health effects -- to find an imminent and substantial endangerment to human health at S.H. Bell’s facility in Ohio. The average manganese levels detected to date at S.H. Bell’s Chicago facility are below the 0.3 µg/m3 standard.**

**For information about the difference between the ATSDR minimum risk level, and EPA’s 1993 reference concentration of .05 ug/m3 referred to by the NRDC, please see <https://www.epa.gov/oh/east-liverpool-ohio-and-glasgow-borough-pennsylvania-air-monitoring-data>.**
